**presented by Peter Bishop
CIGRE AU B5 Convenor**

- CIGRE AU SEAPAC 2015 :
 - Four different proprietary solutions 😞
 - More in earlier SEAPAC
- Frequent approach is a single push button on IED front panel to:
“Isolate GOOSE”,
a few use station HMI screen
 - Note: we don't isolate wires, so why isolate GOOSE?
 - Isolating GOOSE is like disconnecting the fibre!
- We should **isolate functions!!**
 - Need to test individual elements of multifunction IED means
 - Leave FUT **OC1_PTOC3** working with certain modified behaviours (e.g. no physical trip)
 - Completely turning off certain other elements : **OC2_PTOC4**, **OC3_PIOC4**, **EF1_PTOC1**, **EF2_PTOC2**, **EF3_PIOC1**
 - Controlling how the **OTHER IEDs** behave when receiving messages from DUT/FUT

Can now test full curve of **OC1_PTOC3**

- Quality “.q” has multiple bits defined in IEC 61850-7-3
- IEC 61850-7-4 Ed2 Annex A **PLUS** revision according to TISSUE 1331 !!!
- Feeder 1 has X and Y protection, feeder is in service, CB closed
 - Testing Feeder1 X Protection MUST NOT TRIP CB
 - Do trip CB for receipt of other Feeder CB Fail operation
 - Do trip CB for receipt of Busbar Prot operation
- Send MMS command to Fdr1 X CB Management IED
 1. Fdr1_X_XCBR.Mod = 2 (blocked) no trip output if incoming message has .q12 = 1
- Send MMS commands to Fdr1 Protection IEDs
 2. Fdr1_X_OC1_PTOC3.Mod = 3 (test) GOOSE issued with .q12 = 1
 3. .Mod = 5 (off) for X prot OC2_PTOC4, OC3_PIOC4, EF1_PTOC1, EF2_PTOC2, EF3_PIOC1
 4. Fdr1_X_RBRF.Mod = 3 (test) or = 5 (off)

Do you trust the technicians will create and follow this procedure correctly at “3am” on-site?

⇒ Predefined & Automated test-mode sequencing!
